

Oleksandr autobiography

I was born on the 12th of July 1991 in Zaporizhzhia city, Ukraine. I didn't go to kindergarten as my mother was a housewife. I have a sister and a brother. My sister Nataliya was born on the 27th of June 1984. My brother Oleg was born on the 2nd of November 1973. I studied at the 80th school, 15 minutes away from my home. I didn't study well at school. I think just because it wasn't interesting for me or I didn't have enough motivation. I had some interest in math, computer science, physics, and some other subjects during school. In early childhood I've got my first computer; I had a desire for computers. Those days, the only thing I did with a computer was gaming. I could play from early morning to late night. We didn't have an internet connection at home, so we used the computer as an offline machine. I played games; my sister did some stuff for studying, Microsoft Word, Excel, etc. After graduating from school, I went to the Classic Private University; the only thing I wanted was to find a profession related to computers. I chose to be a programming engineer. I got a bachelor's degree in Software Engineering in 2013. In 2015 completed the full course of "Classic Private University" and obtained a complete higher education in the speciality "System software" and obtained the qualification of Master of System Software, Software Engineer. At the university, I started to learn the Java programming language and Android development. After the university, I started looking for a job.

Companies:

2015 - 2017: Motor Corporation as a junior system administrator. In the company, I developed my first commercial application for Motor Clinic. Also, I worked on a Java desktop application for reading brain waves using a special head interface, the Emotiv Epoc EEG headset. After some time, there were a lot of problems in the company, and I started to look for another job, also because I wanted a bigger salary.

February 2017 - July 2019: I was working at Light IT company as a junior Android developer; it was really good at the company, and I really enjoyed working there. I've got cool friends there; they are Gregory Galushka, Artem Erishev, Dima Vasilenko, and Nikolay Lavrov. There were 3 projects I was working on.

Portal Light IT: Non-commercial application for internal company use. It was a company mobile portal for employees' profiles and company news, events, and other useful information that you might need as an employee.

Tech stack: Java, EventBus, GreenDAO, Android Services, custom views, Firebase tools, Retrofit, Crashlytics

Appotek: a healthcare project, key features: appointment to doctor, visit in clinic or video call, reminder to take pills, polls on how patient feels themselves, and other features related to health, body measurements.

Tech stack: Java, WebRTC, Socket.IO, Android annotations, Butter Knife, Room persistence, custom views

Teamicate: a calendar aggregator application for collecting all events from all calendars in one calendar app.

Tech stack: Java, VIPER, Android Services, Realm DB, Content Provider, custom views, Firebase tools, Google Maps, Google Calendar API, Retrofit

July 2019 - March 2021: I was working at Solanteq product company as an Android/iOS native FinTech application engineer. I've decided to relocate to Kyiv in order to work there. The day I've got a job offer on my way to home I've got into a small car accident. I was driving a motorcycle (Honda CB125E) and a someone on a car didn't see me tried to get on the main road blocked my way and I hit the car. I have a good reaction so I hit brakes and the puch was light enough that I didn't get any injury. I was enioing working at Solanteq, after working days I was exploring Kyiv city. I've got the best friend that is Sergey Karavatskiy. We spent a log of time together, we have a lot in common.

There were a lot of projects separated in different build flavours: Vostok bank, Alfa insurance, Банк Власний Рахунок, Обанк, Azericard, Rws bank. Basically it was one project with common features but with unique designs separated by build flavours.

Tech stack: Java, Kotlin, Server Driven UI, Android Services, Realm DB, Content Provider, custom views, Firebase tools, Google Maps, Camera API, build flavour to switch between projects, Retrofit,

April 2021 - December 2022: Geniusee - outsource/outsfaff company as a middle Android/iOS engineer. It was really beautiful office on the last floor of the building. After some time, we moved in another office and I liked to park my convertible Peugeot 206cc near the window so I could enjoy the view out of my office window. I really enjoyed working on the main project Zytara where, Billy Mullins - Chief Technology Officer (CTO), - Nata Yurchak and Daria Donchenko project managers, Ivan Podibka - Android and iOS lead, Denis Kashpersky - Business analyst, Alina Korniienko and Olena Nikitina - QA, Andriy Malyna - Backend Engineer, Nazariy Hazdun, Geniusee CTO, Anton Kolvakh - DevOps engineer (with Anton we were wondering about business to open, he dreamed about Doner kiosk and I dreamed about car service, once we were sitting in one room and thought about idea to that I open car service and Anton will place Doner kiosk on the location of the car service). The project ended up somewhere in the middle of summer in 2022 because the war Russia started. Nastya Shevchenko is out of scope of project but have a special place in my heart.

Zytara is a new bright star in the FinTech sky. The company's creators came up with the new concept of neobank for Generation Z and gamers. The challenge they introduced to us was to create a financial application that allows setting the theme of your favorite esport team as a skin for your card. The concept implied financial education for Generation Z using gamification tools and teaching accountability for children. It also has to help parents manage spending limits, track transaction history, check savings, and impose restrictions.

"Geniusee team provided conscientious engineers with hearts of gold. The team members treated the product like they were owners. They cared deeply about the outcome and worked diligently to meet accelerated project timelines, often outside regular work hours. The senior

team members were self-sufficient and often brought solid technical ideas to solve problems. They were communicative and highly collaborative in system design processes and all other product and software development lifecycle phases.”

Billy Mullins, CTO Zytara

Zytara project - project from scratch, I was added at the very beginning to an existing Android team. It is a FinTech project for the US market. The size of the team was approximately 21 people.

Role: My role was to estimate, communicate with the project owner, project manager, and business analyst, develop new features, and cover them with tests. The size of the Android team was from 4 to 7 developers. Code review process.

Tech stack: SSL pinning, Android biometric auth, android keystore, Github and Bitrise was used for CI/CD, SonarQube were used, Kotlin coroutines, LiveData, Firebase dynamic links/analytics/, Mockk (for mocking objects in tests), custom views, crashlytics, GraphQL, AWS app sync, Koin for DI, Mockk (for mocking objects in tests), Glide

UV-Bodyguard (ajuma) project - I joined for support and new features/redesign. The UV Bodyguard is a portable tracker that measures local UV radiation and uses its app to alert you when to seek shade, calculating personalized sun exposure limits based on your skin type and sunscreen SPF.

Role: My role was to estimate, communicate with the project owner and project manager, and implement new features. I was the only Android developer on the project. Team size was 5 people.

Tech stack: GitHub and Bitrise were used for CI/CD, SonarQube, Kotlin coroutines, LiveData, Firebase Analytics and Crashlytics, Retrofit, Koin for DI

Internal project company digital portal - working on an internal project completely build on Jetpack Compose. It's lifestyle/tools/ management application for internal usage. The app was built from scratch using Jetpack Compose and the MVVM pattern. It's clean architecture approach under the hood. Kotlin only. GitLab and Bitrise were used for CI/CD. Other stack: Kotlin coroutines, Kotlin Flow, Navigation component, Retrofit, Koin, custom views, Coil, Lottie animation, Google Maps

January 2023 - July 2025: Devlight this is my first full remote company with the office in Ivano-Frankivsk. My position was middle Android engineer. I didn't get a lot of friends there, the only person I can consider as a person we still in touch is Andrii Malitchuk. In April 2023 I visited office for one week, it was cool experience. I enjoyed the trip very well.

Eldorado project - mainly support and additional features, 8 people on the project.

Role: My role was support and new features, also communication with project owner, project manager, business analyst

Tech stack: Clean architecture, MVVM pattern for presentation layer, Android view for presentation, Kotlin Coroutines, Flow, Retrofit client for (networking), Firebase push, crashlytics, analytics and config, Single activity and multi fragment app

Blago project - project from the scratch, 9 people on the project. It is real estate application.

Role: There were 2 android devs, my role was to estimate, communication with project owner, building multi module application.

Tech stack: Clean architecture, MVVM pattern for presentation layer, Koin for DI, Jetpack Compose, Kotlin Coroutines, Flow, Ktor (networking). Firebase push, crashlytics, analytics and config, deep links

Brocard- project from the scratch, I was added on the very beginning as a second android developer, 9 people on the project. It is e-commerce application for chain of stores and an online retailer of beauty products.

Role: There were 2 android devs, my role was to estimate, communication with project owner, project manager, business analyst, building multi module application. Code review process.

Tech stack: Clean architecture, MVVM pattern for presentation layer, Android view for presentation, Hilt for DI, Kotlin Coroutines, Flow, Apollo client for (networking), Lottie for animations. Firebase push, crashlytics, analytics and config, deep links, CI/CD was based on Bitbucket pipeline.

Holdo project - project from the scratch, 7 people on the project. The project is about food order and delivery from different chain restaurants.

Role: I was only android developer on the project. Close to the end of the project I was mentoring a junior. My role was to estimate, communication with project owner, project manager, business analyst. Discuss scope of work, prioritize tasks. Close communication with backend team for providing more suitable APIs. Building multi module application, integrate CI/CD based on Bitbucket pipeline, with firebase app distribution. Base test coverage. Code review process.

Tech stack: Clean architecture, MVVM pattern for presentation layer, Koin for DI, Room DB, Jetpack Compose, Jetpack navigation, Kotlin Coroutines, Flow, Ktor (networking), Coil for images, Lottie for animations. Firebase push, crashlytics, analytics and config.

Kontakt project - project from the scratch, 9 people on the project. It is loyalty program application for Azerbaijan market.

Role: I was lead android developer on the project with junior developer from the very beginning of the project. My role was to estimate, communication with project owner, project manager, business analyst. Discuss scope of work, prioritize tasks. Give tasks to my junior dev. Building multi module application, integrate CI/CD based on Bitbucket pipeline, with firebase app distribution. Base test coverage. Code review process. Best practices suggestions for backend and frontend communication, and overall share my expertise. Close communication with backend team.

Tech stack: Android biometry auth, android keystore, Clean architecture, MVI pattern for presentation layer, Koin for DI, Jetpack Compose, Jetpack navigation, Kotlin Coroutines, Flow, Ktor (networking), Coil for images, Lottie for animations. Firebase push, crashlytics, analytics and config, exoplayer for video playing,

I started to write articles on Medium platform while I didn't have job between Devlight and Capgemini

September 2025 - present Capgemini Ukraine - Sr. Android Engineer NDA project that is used across the globe for a long time in news domain. This is very big project my Senior Engineering Manager is Bruce Demske who visited our office during wartime. His son Lucas how is volunteer in Ukraine.

NDA project - big USA project used cross the globe in news domain. Over 10 million downloads. Android team about 70 engineers divided on squads.

Role: Communication through squads, delivering features. Help other participants, pull requests review. Participation in engineering and non engineering meetings.

Techstack: Clean architecture, Hilt, Kotlin Coroutines, Flow, Jetpack Compose, Jetpack navigation, Room DB, Graph QL, Apollo, Datadog, Github and Bitrise for CI/CD, Statsig tool

Core Qualifications:

- 9 years Android developing experience
- Kotlin, Java, Swift, Python, javascript, AI Engineer
- Jetpack compose, Kotlin Coroutines, Flow, custom views, Room persistence, DI (Koin, Hilt), Firebase analytics, configurations, push notifications, map SDK, Gradle convention plugins, Ktor, Retrofit, Unit and UI tests, CI/CD (Bitrise, SonarQube, Firebase app distribution) etc.
- Video MediaPlayer and ExoPlayer, camera SDK,
- Experience with both REST API and GraphQL
- KMP & CMP - Kotlin Multiplatform and Compose Multiplatform, Core ML and Augmented Reality kit on iOS

Certificates:

Udemy Certificate

AI Engineer Core Track: LLM Engineering, RAG, QLoRA, Agents

Instructors Ligency, Ed Donner

Date Aug. 10, 2026

Length 33.5 total hours

Udemy Certificate

AI Engineer Production Track: Deploy LLMs & Agents at Scale

Instructors Ligency , Ed Donner

Date Aug. 30, 2026

Length 18.5 total hours
